

Abstract**Fluid damper**

The invention is a fluidic damper which comprises a closed cylinder (100)
5 containing a valve mechanism. The valve mechanism is attached to a piston rod (110),
a portion of which (the piston rod) emerges through an opening in one end wall of the
cylinder (100). The valve mechanism (90) comprises a disc (10) with an axle (15), a
rotatable annular cover piece (20) and an annular turning piece (40). A spring (30) is
disposed between the cover piece (20) and the turning piece (40).
